Software Requirements Specification (SRS)

Purpose: This document provides a comprehensive description of the intended purpose, functionality, and requirements for the software system *Bookly*. It serves as a communication tool between stakeholders, developers, and testers, ensuring a shared understanding of both functional and non-functional expectations.

1. Introduction

- **Project Name:** Bookly
- **Prepared by:** Group 5 - 404 Founders
- **Version:** 1.0.0
- **Date:** 2026/10/21

2. Overall Description

2.1 Product Perspective

Bookly is a custom-built desktop application designed to help small bookstores manage their daily operations. It replaces traditional methods like handwritten logbooks or general spreadsheet software, which can cause errors and take too much time. The program works as an independent system that keeps all the store's data in one place. It focuses mainly on book management, stock control, and recording sales transactions. Bookly provides a simple and dedicated user interface, making it very easy for the bookstore staff to learn and use without needing complex technical knowledge.

2.2 Product Functions

- Book registration to add new books to the system with their basic details, such as title, author, price, and stock.
- Book information management to view, modify, and delete the information of the registered books.
- Inventory management to control the available stock and update quantities automatically when a book is sold or added.
- Sales registration to process customer purchases, selecting the books and quantities sold.
- Automatic calculation of the total cost of a sale based on the book prices and quantities.
- Invoice generation to create a proof of purchase for the customer after a sale is completed.
- Book search and consultation to find specific books easily using the title, author or category.

- Sales reports to analyze the income, best-selling books, and overall sales during a specific period of time.
- Customer registration to save basic contact information, record their reading preferences, and send personalized book recommendations via email.

2.3 User Characteristics

The main users of the Bookly system will be store clerks and bookstore managers. Store clerks will use the program daily to assist customers quickly, search for specific book titles, and process sales at the checkout. Bookstore managers will use the application to analyze sales reports, check the store's revenue, and make decisions about restocking popular books. Because Bookly has a lightweight and specific design, the users do not need advanced computer skills or special technical training to use it effectively.

2.4 Constraints

- The system must be developed as a desktop application.
- The software must remain simple and suitable for a small bookstore, avoiding unnecessary or highly complex functions.
- The application must be able to automatically deduct purchased quantities directly from the available stock exactly when a transaction is finished.

3. Functional Requirements

ID	Description	Priority
PBI-01	The system must allow users to register books with information such as title, author, category, price, and stock.	High
PBI-02	The system must allow users to view, modify, and delete information about registered books.	High
PBI-03	The system must allow users to control the available stock of books and update quantities when books are added or sold	High
PBI-04	The system must allow users to register sales by selecting one or more books and recording the date and quantity sold.	High
PBI-05	The system must automatically calculate the total cost of a sale based on the selected books, quantities, and prices	Medium

PBI-06	The system must generate an invoice or proof of purchase containing the information of the sale and its total amount.	Medium
PBI-08	The system must allow users to search and consult books by title, author or category..	Medium
PBI-07	The system must generate reports about sales and income for a specific period.	Low
PBI-09	The system must allow users to register customers and store their basic information and email address.	Low
PBI-10	The system must allow users to register customers' preferred book categories and authors.	Low
PBI-11	The system must generate book recommendations based on the customer's registered preferences and purchase history.	Low

4. Non-Functional Requirements

Category	Requirement
Usability	The system must have a lightweight and dedicated user interface that minimizes technical complexity for the bookstore staff.
Performance	The system must offer instantaneous search capabilities and automatically calculate totals without manual delays.
Data Integrity	The system must secure the store's data in a single centralized system to prevent file overwrites, missing entries, and version control issues.
Platform	The software must be designed and developed exclusively as a desktop application.

5. External Interface Requirements

- **User Interface:** A simple desktop graphical interface designed specifically around bookstore daily workflows, allowing clerks to quickly manage inventory, search books, and process sales without requiring advanced technical training.
- **Printer Interface:** The system must be able to output readable physical printed invoices or digital receipts directly from the application when a purchase is confirmed.
- **Email Interface:** The application must integrate with an email sending service to deliver personalized book recommendations to the customers' registered email addresses.

6. Assumptions and Dependencies

- The system is built for a small bookstore with basic management needs.
- Store clerks and managers possess basic computer skills to operate a desktop application without requiring advanced technical training.
- Generating physical invoices depends on the bookstore having a connected and functional printer.
- Sending personalized book recommendations to customers depends on an active internet connection and a working email service.

7. Appendices

Glossary

Term	Definition
Category	A classification used to organize books depending on their specific content.
Revenue	The total money generated during a specific period, calculated by adding the totals of all sales made during that time.
Sale	A transaction where one or more books are purchased by a customer.
Stock	The exact quantity of book copies that are currently available for sale in the bookstore.
